The learning objective of this chapter are:

- To understand the incorporation and implications of material nonhomogeneity across the cross section in the theories for axial members, circular shafts in torsion, and the symmetric bending of beams.
- To understand the use of the rule of mixture, and the inverse rule of mixtures in obtaining the macroscopic properties of a composite from its constituent properties.
Pick up point in the logic

- Assumption 8 of material homogeneity is not valid.
- Write each integral over the area as sum of integrals over each material area and take material constant outside the integral.
Composite Axial Members

\[ \sigma_{xx} = \frac{du}{dx}(x) \]

**Internal Forces and Moments**

\[ N = \int_A \sigma_{xx} \, dA \quad M_z = -\int_A y \sigma_{xx} \, dA = 0 \quad \text{or} \quad N = \frac{du}{dx}(x) \int_A E \, dA \]

Location of origin:

\[ \int_A y E \, dA = 0 \]

**Formulas for composite axial rods**

\[ N = \frac{du}{dx} \left[ E A \int_A E_1 \, dA + E_2 \, dA + \cdots + E_n \, dA \right] + \frac{du}{dx} \left[ \sum_{j=1}^{n} E_j A_j \right] \]

\[ (\sigma_{xx})_i = \frac{N E_i}{\sum_{j=1}^{n} E_j A_j} \]

\[ u_2 - u_1 = \frac{N(x_2 - x_1)}{\sum_{j=1}^{n} E_j A_j} \]

Location of axial force application (origin)

\[ \eta_c = \frac{\sum_{j=1}^{n} \eta_j E_j A_j}{\sum_{j=1}^{n} E_j A_j} \]

- Axial strain is uniform across entire cross section of a composite rod.
- Axial stress is uniform in each material.
- There is a discontinuity in axial stress at junction of each material.
Example 4.2

\[ \varepsilon_{xx} = -200\mu \quad E_{steel} = 30,000 \text{ ksi} \quad E_{wood} = 8,000 \text{ ksi} \]

Homogenous cross section

Laminated cross section

Homogenous & Laminated

Strain

Stress

Internal Axial Force For Composite

\[ N_{St} = \int_{A_{St}} \sigma_{xx} dA = (6)(2)(1/4) \]

\[ N_{W} = \int_{A_{W}} \sigma_{xx} dA = (1.6)(2)(1) \]

\[ N_{Sb} = \int_{A_{Sb}} \sigma_{xx} dA = (6)(2)(1/4) \]

\[ N = N_{St} + N_{W} + N_{Sb} \]
C4.1 A wooden rod \( (E_W = 2000 \text{ ksi}) \) and steel strip \( (E_s = 30,000 \text{ ksi}) \) are fastened securely to each other and to the rigid plates as shown below. Determine (a) the location \( h \) of the line along which the external forces must act to produce no bending, (b) the maximum axial stress in steel and wood.
C4.2 A column for use in a building is modeled as shown below. The column is constructed by reinforcing concrete with nine steel circular bars of diameter 1 inch. The modulus of elasticity for concrete and steel are $E_c = 4,500$ ksi and $E_s = 30,000$ ksi. Determine the maximum axial stress in concrete and steel.
Composite Shafts

\[ \tau_{x \theta} = G \rho \frac{d\phi}{dx}(x) \]

**Internal Forces and Moments**

\[ T = \int_A \rho \tau_{x \theta} \, dA \quad \text{or} \quad T = \frac{d\phi}{dx} \int_A G \rho \theta^2 \, dA \]

**Formulas for composite shafts**

\[ T = \frac{d\phi}{dx} \left[ \int_{A_1} G_1 \rho \theta^2 \, dA + \int_{A_2} G_2 \rho \theta^2 \, dA + \cdots + \int_{A_n} G_n \rho \theta^2 \, dA \right] \]

\[ T = \frac{d\phi}{dx} \left[ \sum_{j=1}^{n} G_j f_j \right] \]

\[ (\tau_{x \theta})_j = \frac{G_j \rho T}{\left[ \sum_{j=1}^{n} G_j f_j \right]} \]

\[ \phi_2 - \phi_1 = \frac{T(x_2 - x_1)}{\left[ \sum_{j=1}^{n} G_j f_j \right]} \]
Variation of torsional shear strain and stress

- Torsional shear strain varies linearly in the radial direction across the composite shaft.
- Maximum torsional shear strain is at the outer most radius of the shaft.
- Torsional shear stress varies linearly in the radial direction in each material with slopes that depend upon shear modulus $G$.
- Torsional shear stress is discontinuous at the junction of each material.
- Maximum torsional shear stress in each material is at point that is furthest from the center.
- Maximum torsional shear stress in the shaft may not be at the outer most radius of the shaft.
C4.3 A solid steel \((G = 80 \text{ GPa})\) shaft 3 m long is securely fastened to a hollow bronze \((G = 40 \text{ GPa})\) shaft that is 2 m long as shown below. Determine (a) the magnitude of maximum shear stress in the shaft. (b) the rotation of section at 1 m from the left wall.
Composite Beams

\[
\sigma_{xx} = -E_y \frac{d^2 y}{dx^2}(x)
\]

**Internal Forces and Moments**

\[
N = \int_A \sigma_{xx} \, dA = 0 \quad M_z = -\int_A y \sigma_{xx} \, dA \quad \text{or} \quad M_z = \frac{d}{dx} \int_A E_y y^2 \, dA
\]

Location of neutral axis origin:

\[
\int_A y E \, dA = 0 \quad \eta_c = \frac{\sum_{j=1}^n \eta_j E_j A_j}{\sum_{j=1}^n E_j A_j}
\]

**Formulas for composite beams**

\[
M_z = \frac{d}{dx} \left[ \int_{A_1} E_1 y^2 \, dA + \int_{A_2} E_2 y^2 \, dA + \cdots + \int_{A_n} E_n y^2 \, dA \right]
\]

\[
M_z = \frac{d}{dx} \left[ \sum_{j=1}^n E_j I_{zz} \right]
\]

\[
(\sigma_{xx})_i = \frac{E_y M_z}{\sum_{j=1}^n E_j I_{zz}}
\]

- Bending normal strain varies linearly across the cross section in the y direction.
- Bending normal strain at a cross section is maximum at a point that is furthest away from the neutral axis.
- Bending normal stress varies linearly in each material with slopes that depend upon the modulus of elasticity \( E \).
- There is a discontinuity in bending normal stress at junction of each material.
- The maximum bending normal stress in each material is at point on the material that is furthest from the neutral axis of a composite beam.
- Maximum bending normal stress may not be at a point that is furthest away from the neutral axis.
Example 4.8

\[ \varepsilon_{xx} = -200 \mu \quad E_{steal} = 30,000 \text{ ksi} \quad E_{wood} = 8,000 \text{ ksi} \]

\[
\begin{array}{c}
\text{Homogenous cross section} \\
\text{Steel} \\
\text{Wood}
\end{array}
\]

\[
\begin{array}{c}
\text{Laminated cross section} \\
\text{Steel} \\
\text{Wood}
\end{array}
\]

Strain

\[
\begin{array}{c}
\text{Homogenous} \\
\varepsilon_{xx} (\mu) \\
0.75 \\
0.5 \\
0.5 \\
0.75 \\
1.2 \\
0.812
\end{array}
\]

\[
\begin{array}{c}
\text{Laminated} \\
\sigma_{xx} (\text{ksi}) \\
0.75 \\
0.5 \\
0.5 \\
0.75 \\
3.0 \\
4.5
\end{array}
\]

Stress

\[
\begin{array}{c}
\text{Homogenous} \\
1.2 \text{ ksi}
\end{array}
\]

\[
\begin{array}{c}
\text{Laminated} \\
4.5 \text{ ksi}
\end{array}
\]
Bending shear stress in composite beams

Equilibrium equation

\[ \tau_{xx} t = -\frac{dN_y}{dx} = -\frac{d}{dx} \int \sigma_{xx} dA \]

\[ \tau_{xx} = -\frac{d}{dx} \int \frac{E_y M_z}{A_z \sum_{j=1}^{n} E_j (I_{zz})_j} dA = \frac{d}{dx} \int \frac{M_z}{\sum_{j=1}^{n} E_j (I_{zz})_j} dA = \frac{d}{dx} \left[ \frac{M_z Q_{comp}}{\sum_{j=1}^{n} E_j (I_{zz})_j} \right] \]

\[ Q_{comp} = \int_{A_z} E_y dA \]

\[ \tau_{sx} = \tau_{xs} = -\frac{Q_{comp} V_y}{\sum_{j=1}^{n} E_j (I_{zz})_j t} \]

\[ Q_{comp} = \sum_{j=1}^{n} E_j (Q_{zz})_j \]

- \( Q_{comp} \) is maximum at the neutral axis.
- \( Q_{comp} \) is continuous at all points on a cross section including the junctions of each material.
- The maximum bending shear stress in each material is at point closest to the neutral axis.
- The maximum bending shear stress at a cross section is at the neutral axis.
- The bending shear stress is continuous at all points on a cross section including the junctions of each material.
C4.4 To improve the load carrying capacity of a wooden beam \((E_W = 2000 \text{ ksi})\) a steel strip \((E_S = 30,000 \text{ ksi})\) is securely fastened to it as shown. Determine (a) the maximum intensity of the load \(w\), if the allowable bending normal stresses in steel and wood are 20 ksi, and 4 ksi respectively. (b) the magnitude of the maximum shear stress steel and wood corresponding to the load in part (a).
C4.5 A concrete beam is reinforced by embedding 20 mm x 20 mm square steel rods in the concrete, loaded and supported as shown. The allowable tensile bending normal stress is 160 MPa, and the allowable compressive bending normal stress for concrete is 20 MPa. Determine the maximum intensity of the distributed load \( w \). Take the moduli of elasticity for steel and concrete as \( E_{st} = 200 \) GPa and \( E_{ccnc} = 28 \) GPa. Neglect the low capacity of concrete to support stresses in tension.
