## FEM in two-dimension

Strain energy density: $U_{o}=\frac{1}{2}\left[\sigma_{x x} \varepsilon_{x x}+\sigma_{y y} \varepsilon_{y y}+\tau_{x y} \gamma_{x y}\right]$
Define: $\{\tilde{\sigma}\}=\left\{\begin{array}{c}\sigma_{\mathrm{xx}} \\ \sigma_{\mathrm{yy}} \\ \tau_{\mathrm{xy}}\end{array}\right\} \quad\{\tilde{\varepsilon}\}=\left\{\begin{array}{l}\varepsilon_{\mathrm{xx}} \\ \varepsilon_{\mathrm{yy}} \\ \gamma_{\mathrm{xy}}\end{array}\right\} \quad \mathrm{U}_{\mathrm{o}}=\frac{1}{2}\{\tilde{\sigma}\}^{\mathrm{T}}\{\tilde{\varepsilon}\}$

## Generalized Hooke's law

Plane stress (All stresses with subscript z are zero)
Plane strain (All strains with subscript z are zero)

$$
\begin{array}{c|c}
\begin{array}{c}
\text { Plane Stress } \\
\sigma_{\mathrm{xx}}=\mathrm{E} \frac{\left[\varepsilon_{\mathrm{xx}}+v \varepsilon_{\mathrm{yy}}\right]}{\left(1-v^{2}\right)} \\
\sigma_{\mathrm{yy}}=\mathrm{E} \frac{\left[\varepsilon_{\mathrm{yy}}+v \varepsilon_{\mathrm{xx}}\right]}{\left(1-v^{2}\right)}
\end{array} & \sigma_{\mathrm{xx}}=\mathrm{E} \frac{\left[(1-v) \varepsilon_{\mathrm{xx}}+v \varepsilon_{\mathrm{yy}}\right]}{(1+v)(1-2 v)} \\
\tau_{\mathrm{xy}}=\frac{\mathrm{E}}{2(1+v)} \gamma_{\mathrm{xy}} & \sigma_{\mathrm{yy}}=\mathrm{E} \frac{\left[(1-v) \varepsilon_{y y}+v \varepsilon_{\mathrm{xx}}\right]}{(1+v)(1-2 v)} \\
\tau_{\mathrm{xy}}=\frac{\mathrm{E}}{2(1+v)} \gamma_{\mathrm{xy}}
\end{array}
$$

Plane Stress
$[\tilde{E}]=\frac{\mathrm{E}}{\left(1-v^{2}\right)}\left[\begin{array}{llc}1 & v & 0 \\ v & 1 & 0 \\ 0 & 0 & \frac{(1-v)}{2}\end{array}\right]$
$[\tilde{E}]=\frac{E}{(1-2 v)(1+v)}\left[\begin{array}{ccc}(1-v) & v & 0 \\ v & (1-v) & 0 \\ 0 & 0 & \frac{(1-2 v)}{2}\end{array}\right]$
$\{\tilde{\sigma}\}=[\tilde{\mathrm{E}}]\{\tilde{\varepsilon}\} \rightarrow[\tilde{\mathrm{E}}]=[\tilde{\mathrm{E}}]{ }^{\mathrm{T}}$
$v \longleftrightarrow v /(1-v)$
$\mathrm{U}_{\mathrm{o}}=\frac{1}{2}\{\tilde{\sigma}\}^{\mathrm{T}}\{\tilde{\varepsilon}\}=\frac{1}{2}\{\tilde{\varepsilon}\}^{\mathrm{T}}[\tilde{\mathrm{E}}]^{\mathrm{T}}\{\tilde{\varepsilon}\}=\frac{1}{2}\{\tilde{\varepsilon}\}^{\mathrm{T}}[\tilde{\mathrm{E}}]\{\tilde{\varepsilon}\}$

## Strain-Displacement

$$
\begin{array}{r}
\varepsilon_{x x}=\frac{\partial u}{\partial x} \quad \varepsilon_{y y}=\frac{\partial v}{\partial y} \quad \gamma_{x y}=\frac{\partial u}{\partial y}+\frac{\partial v}{\partial x} \\
\{\varepsilon\}=\left[\begin{array}{cc}
\frac{\partial}{\partial x} & 0 \\
0 & \frac{\partial}{\partial y} \\
\frac{\partial}{\partial y} & \frac{\partial}{\partial x}
\end{array}\right]\left\{\begin{array}{l}
u \\
v
\end{array}\right\}
\end{array}
$$

Displacements approximating:

$$
u(x)=\sum_{i=1}^{n} u_{i}^{(e)} f_{i}(x, y) \quad v(x)=\sum_{i=1}^{n} v_{i}^{(e)} f_{i}(x, y)
$$

$$
\left\{\begin{array}{c}
\mathrm{u} \\
\mathrm{v}
\end{array}\right\}=\left[\begin{array}{cccccccc}
\mathrm{f}_{1} & 0 & \mathrm{f}_{2} & 0 & \ldots & \ldots & \mathrm{f}_{\mathrm{n}} & 0 \\
0 & \mathrm{f}_{1} & 0 & \mathrm{f}_{2} & \ldots & \ldots & 0 & \mathrm{f}_{\mathrm{n}}
\end{array}\right]\{\mathrm{d}\}
$$

$$
\begin{aligned}
& \{\varepsilon\}=\left[\begin{array}{cc}
\frac{\partial}{\partial \mathrm{x}} & 0 \\
0 & \frac{\partial}{\partial \mathrm{y}} \\
\frac{\partial}{\partial \mathrm{y}} & \frac{\partial}{\partial \mathrm{x}}
\end{array}\right]\left[\begin{array}{ccccccc}
\mathrm{f}_{1} & 0 & \mathrm{f}_{2} & 0 & \ldots & \ldots & \mathrm{f}_{\mathrm{n}} \\
0 \\
0 & \mathrm{f}_{1} & 0 & \mathrm{f}_{2} & \ldots & \ldots & 0
\end{array}\right]\left\{\mathrm{f}_{\mathrm{n}}\right][\mathrm{d}\}=[\mathrm{B}]\{\mathrm{d}\} \\
& \text { [B] }=\left[\begin{array}{ccccccccc}
\frac{\partial f_{1}}{\partial x} & 0 & \frac{\partial f_{2}}{\partial x} & 0 & \ldots & \ldots & \frac{\partial f_{n}}{\partial x} & 0 \\
0 & \frac{\partial f_{1}}{\partial y} & 0 & \frac{\partial f_{2}}{\partial y} & \ldots & \ldots & 0 & \frac{\partial f_{n}}{\partial y} \\
\frac{\partial f_{1}}{\partial y} & \frac{\partial f_{1}}{\partial x} & \frac{\partial f_{2}}{\partial y} & \frac{\partial f_{2}}{\partial x} & & & & \frac{\partial f_{n}}{\partial y} & \frac{\partial f_{n}}{\partial x}
\end{array}\right]
\end{aligned}
$$

- Matrix [B] is called strain-displacement matrix

$$
\mathrm{U}_{\mathrm{o}}^{(\mathrm{e})}=\frac{1}{2}\{\mathrm{~d}\}^{\mathrm{T}}\{\mathrm{~B}\}^{\mathrm{T}}[\tilde{\mathrm{E}}]\{\mathrm{B}\}\{\mathrm{d}\}
$$

Strain Energy: $U^{(e)}=\int_{V} U_{o}^{(e)} d V$

$$
\mathrm{U}^{(\mathrm{e})}=\int_{\mathrm{V}} \frac{1}{2}\{\mathrm{~d}\}^{\mathrm{T}}\{\mathrm{~B}\}^{\mathrm{T}}[\tilde{\mathrm{E}}]\{\mathrm{B}\}\{\mathrm{d}\} \mathrm{dV}=\frac{1}{2}\{\mathrm{~d}\}^{\mathrm{T}}\left[\mathrm{~K}^{(\mathrm{e})}\right]\{\mathrm{d}\}
$$

Element stiffness matrix: $\left[\mathrm{K}^{(\mathrm{e})}\right]=\int_{\mathrm{V}}[\mathrm{B}]^{\mathrm{T}}[\mathrm{E}][\mathrm{B}] \mathrm{dV}$
Variation in potential energy: $\delta \Omega^{(\mathrm{e})}=\{\delta \mathrm{d}\}^{\mathrm{T}}\left(\left[\mathrm{K}^{(\mathrm{e})}\right]\{\mathrm{d}\}-\left\{\mathrm{R}^{\mathrm{e}}\right\}\right)$

## Overview of approximate methods

## Some Jargon

## 1-D Heat Conduction:

$\frac{d^{2} T}{d x^{2}}=0 \quad 0 \leq \mathrm{x} \leq \mathrm{L}$

$-\left.k \frac{d T}{d x}\right|_{x=0}=0 \quad$ Natural Boundary Condition $\left.T\right|_{x=L}=T_{o} \quad$ Essential Boundary Condition

Beam Bending

$V=-\frac{d}{d \mathrm{x}}\left(\mathrm{EI} \frac{d^{2} \mathrm{v}}{d \mathrm{x}^{2}}\right)=\mathrm{P}$
$M=\mathrm{EI} \frac{d^{2} \mathrm{v}}{d \mathrm{x}^{2}}=0$
$\mathrm{v}(0)=0$
$\left.\frac{d \mathrm{v}}{d \mathrm{x}}\right|_{\mathrm{x}=0}=0 \quad \square$ Essential Boundary Condition

## Approximation of boundary value problem

$$
\mathrm{D}_{\mathrm{e}} \mathrm{u}=\mathrm{g}_{\mathrm{e}} \text { on } \Gamma_{\mathrm{n}} \longrightarrow \text { Nifferential Equation } \quad \text { in } \Omega \longrightarrow \text { Essential Boundary Coundary Condition }
$$

$$
\begin{aligned}
& \text { n } \\
& u=\sum_{j=1} c_{j} \phi_{j} \\
& \phi_{\mathrm{j}} \text { set of approximating functions } \\
& \text { set of } \phi_{\mathrm{j}} \text { is complete and independent. } \\
& \text { n } \\
& \mathrm{e}_{\mathrm{d}}=\sum \mathrm{c}_{\mathrm{j}} \mathrm{~L} \phi_{\mathrm{j}}-\mathrm{f} \quad \text {-Error in Differential Equation } \\
& \mathrm{j}=1 \\
& \text { n } \\
& \mathrm{e}_{\mathrm{n}}=\sum_{\substack{\mathrm{j}=1 \\
\mathrm{n}}} \mathrm{c}_{\mathrm{j}} \mathrm{D}_{\mathrm{n}} \phi_{\mathrm{j}}-\mathrm{g}_{\mathrm{n}} \text {-Error in Natural Boundary Condition } \\
& \mathrm{e}_{\mathrm{e}}=\sum_{\mathrm{j}=1} \mathrm{c}_{\mathrm{j}} \mathrm{D}_{\mathrm{e}} \phi_{\mathrm{j}}-\mathrm{g}_{\mathrm{e}} \quad \text {-Error in Essential Boundary Condition }
\end{aligned}
$$

## Commonality and Differences in Approximate Methods

## Commonalities

- Produce a set of algebraic equations in the unknown constants $c_{j}$.
- Choose $\phi_{\mathrm{i}}$ to set one (or two) of the errors $\mathrm{e}_{\mathrm{d}}, \mathrm{e}_{\mathrm{e}}$, or $\mathrm{e}_{\mathrm{n}}$ to zero
- Minimize the remaining error(s).

## Differences

- Which error is set to zero

Domain Methods: $\mathrm{e}_{\mathrm{e}}=0$ or $\mathrm{e}_{\mathrm{n}}=0$
Boundary Methods: $\mathrm{e}_{\mathrm{d}}=0$

- Error Minimizing Process

## Independence of $\phi_{\mathrm{i}}$

- No $\phi_{i}$ can be obtained from a linear combination of other $\phi_{i}$ 's in the set.
- If the set of functions $\phi_{\mathrm{i}}$ are not independent then the equations in the matrix will not be independent and the matrix will be singular.
Completeness of $\phi_{i}$
- In a series sequence no term should be skipped.
- If a set is not complete then the solution may not converge for some problems.

## Error Minimization

## Weighted Residue

$$
\iint_{\Omega} \Psi_{\mathrm{i}}^{(\mathrm{d})} \mathrm{e}_{\mathrm{d}} \mathrm{dxdy}+\int_{\Gamma_{\mathrm{e}}} \Psi_{\mathrm{i}}^{(\mathrm{e})} \mathrm{e}_{\mathrm{e}} \mathrm{ds}+\int_{\Gamma_{\mathrm{n}}} \Psi_{\mathrm{i}}^{(\mathrm{n})} \mathrm{e}_{\mathrm{n}} \mathrm{ds}=0
$$

FEM-Stiffness version: $e_{e}=0$

$$
\iint_{\Omega} \psi_{i}^{(d)} e_{d} d x d y+\int_{\Gamma_{n}} \psi_{i}^{(n)} e_{n} d s=0
$$

FEM-Flexibility version: $\mathrm{e}_{\mathrm{n}}=0$

$$
\iint_{\Omega} \psi_{i}^{(d)} e_{d} d x d y+\int_{\Gamma_{e}} \Psi_{i}^{(e)} e_{e} d s=0
$$

BEM: $\mathrm{e}_{\mathrm{d}}=\mathbf{0}$

$$
\int_{\Gamma_{n}} \psi_{\mathrm{i}}^{(\mathrm{n})} \mathrm{e}_{\mathrm{n}} \mathrm{ds}+\int_{\Gamma_{\mathrm{e}}} \psi_{\mathrm{i}}^{(\mathrm{e})} \mathrm{e}_{\mathrm{e}} \mathrm{ds}=0
$$

FEM: Discretization process is on domain of the entire body $\Omega$
BEM: Discretization process is on the boundary of the body $\Gamma$

- In FEM stiffness matrix the equilibrium equation on stresses (differential equations) and boundary conditions on stresses (natural boundary conditions) are approximately satisfied.
- In FEM flexibility matrix the compatibility equation on stresses (differential equations) and boundary conditions on displacements (essential boundary conditions) are approximately satisfied.

## Constant Strain Triangle (CST)

- Displacements are linear in x and y , resulting in constant strains.

$$
\begin{gathered}
u=a_{0}+a_{1} x+a_{2} y \quad v=b_{0}+b_{1} x+b_{2} y \\
\varepsilon_{x x}=\frac{\partial u}{\partial x}=a_{1} \quad \varepsilon_{y y}=\frac{\partial v}{\partial y}=b_{2} \quad \gamma_{x y}=\frac{\partial u}{\partial y}+\frac{\partial v}{\partial x}=a_{2}+b_{1}
\end{gathered}
$$

$$
\left\{\begin{array}{l}
\varepsilon_{\mathrm{xx}} \\
\varepsilon_{\mathrm{yy}} \\
\gamma_{\mathrm{xy}}
\end{array}\right\}=\frac{1}{2 \mathrm{~A}}\left[\begin{array}{cccccc}
\mathrm{y}_{23} & 0 & \mathrm{y}_{31} & 0 & \mathrm{y}_{12} & 0 \\
0 & x_{32} & & x_{13} & & x_{21} \\
\mathrm{x}_{32} & \mathrm{y}_{23} & x_{13} & y_{31} & x_{21} & y_{12}
\end{array}\right]\left\{\mathrm{d}^{(\mathrm{e})}\right\}=[\mathrm{B}]\left\{\mathrm{d}^{(\mathrm{e})}\right\}
$$

$$
\mathrm{x}_{\mathrm{ij}}=\mathrm{x}_{\mathrm{i}}-\mathrm{x}_{\mathrm{j}} \quad \mathrm{y}_{\mathrm{ij}}=\mathrm{y}_{\mathrm{i}}-\mathrm{y}_{\mathrm{j}}
$$

$$
\left[\mathrm{K}^{(\mathrm{e})}\right]=\int_{\mathrm{V}}[\mathrm{~B}]^{\mathrm{T}}[\mathrm{E}][\mathrm{B}] \mathrm{dV}=[\mathrm{B}]^{\mathrm{T}}[\mathrm{E}][\mathrm{B}] \mathrm{tA}
$$

## Pascal's Triangle

- Used for determining a complete set of polynomial terms in two dimensions. ${ }^{\text {b }}$

- Greater the degree of freedom, less stiff will be element.
- Interpolation functions are easier to develop with area coordinates.

## Natural Coordinates

- Coordinates which vary between 0 and 1 or -1 and 1 .
- Natural coordinates and non-dimensional coordinates.

1-d Coordinates

Possibility 1

$L_{l}(\xi)=(1-\xi)$
$L_{l}(\xi)=(1-\xi) / 2$
$L_{2}(\xi)=\xi$

$$
L_{2}(\xi)=(1+\xi) / 2
$$

## 2-D Triangular elements (Area Coordinates)

Homework Problem: Write cubic interpolation functions using area coordinates for nodes 1,2 and 10 .

## Bi-Linear Quadrilateral

$$
\begin{gathered}
u=a_{0}+a_{1} x+a_{2} y+a_{3} x y \quad v=b_{0}+b_{1} x+b_{2} y+b_{3} x y \\
\varepsilon_{x x}=\frac{\partial u}{\partial x}=a_{1}+a_{3} y \quad \varepsilon_{y y}=\frac{\partial v}{\partial y}=b_{2}+b_{3} x \\
\gamma_{x y}=\frac{\partial u}{\partial y}+\frac{\partial v}{\partial x}=\left(a_{2}+b_{1}\right)+a_{3} x+b_{3} y
\end{gathered}
$$

$$
\begin{aligned}
& \mathrm{u}(\mathrm{x}, \mathrm{y})=\sum_{\mathrm{i}=1}^{4} \mathrm{~N}_{\mathrm{i}}(\mathrm{x}, \mathrm{y}) \mathrm{u}_{\mathrm{i}}^{(\mathrm{e})} \\
& \mathrm{v}(\mathrm{x}, \mathrm{y})=\sum_{\mathrm{i}=1} \mathrm{~N}_{\mathrm{i}}(\mathrm{x}, \mathrm{y}) \mathrm{v}_{\mathrm{i}}^{(\mathrm{e})}
\end{aligned}
$$

## Interpolation functions in natural coordinates

$$
\begin{aligned}
\xi=\mathrm{x} / \mathrm{a} & \eta=\mathrm{y} / \mathrm{b} \\
\mathrm{~N}_{1}=\frac{1}{4}(1-\xi)(1-\eta) & \mathrm{N}_{2}=\frac{1}{4}(1+\xi)(1-\eta) \\
\mathrm{N}_{3}=\frac{1}{4}(1-\xi)(1+\eta) & \mathrm{N}_{4}=\frac{1}{4}(1+\xi)(1+\eta) \\
\frac{\partial \mathrm{N}_{\mathrm{i}}}{\partial \mathrm{x}}=\frac{\partial \mathrm{N}_{\mathrm{i}} \partial \xi}{\partial \xi} \frac{\partial \xi}{\partial \mathrm{x}}=\frac{1}{\mathrm{a}} \frac{\partial \mathrm{~N}_{\mathrm{i}}}{\partial \xi} & \frac{\partial \mathrm{~N}_{\mathrm{i}}}{\partial \mathrm{y}}=\frac{\partial \mathrm{N}_{\mathrm{i}}}{\partial \eta} \frac{\partial \eta}{\partial \mathrm{y}}=\frac{1}{\mathrm{~b}} \frac{\partial \mathrm{~N}_{\mathrm{i}}}{\partial \eta}
\end{aligned}
$$

## Other Quadrilaterals

## Complete quadratic

- The stiffness (row and column) related to node 5 is known at element level and as rows and columns of other elements do not add to it.

## Quadratic element often used in practice:

- When internal nodes are eliminated care has to be exercised to ensure the mesh from such elements will converge.

## Mechanical Loads

There are three types of mechanical loads

## 1. Concentrated Forces or Moments

- The loads must be applied at nodes when making the mesh.
- Theoretically the stresses are infinite at the point of application, hence in the neighborhood of concentrated load a large stress gradient can be anticipated.

## 2. Tractions

- Forces that act on the bounding surfaces.

$$
\mathrm{S}_{\mathrm{x}}=\sigma_{\mathrm{xx}} \mathrm{n}_{\mathrm{x}}+\tau_{\mathrm{xy}} \mathrm{n}_{\mathrm{y}} \quad \mathrm{~S}_{\mathrm{y}}=\tau_{\mathrm{yx}} \mathrm{n}_{\mathrm{x}}+\sigma_{\mathrm{yy}} \mathrm{n}_{\mathrm{y}}
$$

$\mathrm{n}_{\mathrm{x}}$ and $\mathrm{n}_{\mathrm{y}}$ are the direction cosines of the unit normal

- Tractions has units of force per unit area and are distributed forces.
- Usually the tractions are specified in local normal and tangential coordinates.
- These distributed forces must be converted to nodal forces.

In two dimensions the bounding surface is a curve. Distributed forces can be converted to nodal forces as was done in 1-d axial and bending problems. (work equivalency) $R_{j}=\int p(x) f_{j}(x) d x$

## 3. Body Forces

- Forces that act at each and every point on the body.
- Gravity, magnetic, inertial are some examples.
- These forces must be converted to nodal forces.
(See section 3.9)
